

CERSIDY

One of the most important things I learned was the value of data cleaning, data preparation and data visualization. By looking at the titanic dataset using pandas for data frames and matplotlib.

I learned that summary statistics provide useful information about this titanic dataset, but they do not tell the whole story. It is important to also examine how the data is distributed and how different groups of survivors compare with the deceased.

Another valuable lesson was the importance of testing and verifying code. The notebook included checks and confirmation messages to make points on correlation of data. This taught me not to simply assume that my code is working, but to test my results and investigate errors when they occur
